Primer of Ecology using R

Hank Stevens

2020-11-24

Contents

Preface **5**
0.1 Acknowledgements 5

1 Theory in Ecology **7**
1.1 Examples of theories 7
1.2 An example: Metabolic Theory of Ecology 7
1.3 Power law scaling implies constant relative differences 7

2 Optimal Foraging **9**
2.1 A prey model 9
2.2 The patch model 9
2.3 A simulation of a prey model 9

3 Simple density-independent growth **11**
3.1 Discrete growth rates of fruit flies in my kitchen 12
3.2 Fruit flies with continuous overlapping generations 12
3.3 Properties of geometric and exponential growth 12
3.4 Modeling with Data: Simulated Dynamics 12

4 Density-independent Demography **13**
4.1 A two stage matrix model 14
4.2 A brief primer on matrices 14
4.3 Decomposing **A** 14
4.4 A three stage model 14
4.5 Projection 14
4.6 Analyzing the transition matrix 14
4.7 Integral projection 14
4.8 R packges for demography 14
4.9 Exploring a real population 14

5 Density-dependent growth **15**
5.1 Continuous logistic growth 15
5.2 Dynamics around the equilibria — stability 15
5.3 Other forms of density-dependent growth 15

5.4 Discrete Density-dependent Growth 15
5.5 Maximum Sustained Yield 15

6 Populations in Space **17**
6.1 Source-sink Dynamics 17
6.2 Metapopulations 17
6.3 Hanski's incidence function 17

7 Competition **19**
7.1 Lotka-Volterra Interspecific Competition 20
7.2 Equilbria 20
7.3 Dynamics at the Equilibria 20
7.4 Return Time and the Effect of r 20
7.5 Indirect competition for resources 20
7.6 Summary 20

8 Mutualisms **21**
8.1 Background 21
8.2 Lotka-Volterra mutualism 21
8.3 Consumer-resource mutualism 21
8.4 Plant-soil feedbacks 21
8.5 Simulations for learning 21

9 Consumer-resource Interactions **23**
9.1 Ratio dependence 23
9.2 Prey dependence 23
9.3 Interlude: Functional response - what an individual predator does 23
9.4 Stability analysis for the prey-dependent Lotka–Volterra model . 23
9.5 Prey carrying capacity and type II functional response 23

10 Host-parasitoid relations **25**
10.1 Independent and random attacks 25
10.2 Aggregation leads to coexistence 25
10.3 Stability of host–parasitoid dynamics 25
10.4 *In Fine* 25

11 Disease **27**
11.1 Closed epidemics 27
11.2 Open epidemics 27
11.3 Modeling data from Bombay 27

12 Food webs and other networks **29**
12.1 Food Web Characteristics 30
12.2 Does omnivory destablize food chains? 30
12.3 Perhaps mutualism stabilizes bipartite networks 30
12.4 Exploring Pandora, right here at home 30

13 Diversity **31**
13.1 Background . . . 32
13.2 Species Composition . . . 32
13.3 Diversity . . . 32
13.4 Species diversity . . . 32
13.5 Rarefaction and total species richness . . . 32
13.6 Distributions . . . 32
13.7 Neutral Theory of Biodiversity and Biogeography . . . 32
13.8 Species–area relations . . . 32
13.9 Diversity Partitioning . . . 32
13.10Summary . . . 32

14 Appendix **33**
14.1 Very introductory materials . . . 34
14.2 Writing your own functions . . . 34
14.3 Iterated Actions: the `apply` Family and Loops . . . 34
14.4 Probability Distributions and Randomization . . . 34
14.5 Numerical integration of ordinary differential equations . . . 34
14.6 Eigenanalysis . . . 34
14.7 Derivation of the right eigenvalues . . . 34
14.8 Symbols used in this book . . . 34

15 References **35**

Preface

Placeholder

0.1 Acknowledgements

Chapter 1

Theory in Ecology

Placeholder

1.1 Examples of theories

1.1.1 Hierarchy theory

1.1.2 A general theory of ecology

1.1.3 Efficient theory

1.2 An example: Metabolic Theory of Ecology

1.2.1 Body-size dependence

1.2.2 Temperature dependence

1.3 Power law scaling implies constant relative differences

Chapter 2

Optimal Foraging

Placeholder

2.1 A prey model

2.1.1 Our intuition

2.1.2 Mathematical support

2.2 The patch model

2.3 A simulation of a prey model

2.3.1 Lab exercise

Chapter 3

Simple density-independent growth

Placeholder

3.1 Discrete growth rates of fruit flies in my kitchen

3.2 Fruit flies with continuous overlapping generations

3.3 Properties of geometric and exponential growth

3.3.1 Average growth rate

3.4 Modeling with Data: Simulated Dynamics

3.4.1 Data-based approaches

3.4.2 Creating and visualizing the data

3.4.3 One simulation

3.4.4 Multiple simulations

3.4.5 A distribution of possible futures

3.4.6 Analyzing results

3.4.7 Inferring processes underlying growth rate

3.4.8 $1/f$ environmental noise

Chapter 4

Density-independent Demography

Placeholder

4.1 A two stage matrix model

4.2 A brief primer on matrices

4.3 Decomposing A

4.4 A three stage model

4.5 Projection

4.6 Analyzing the transition matrix

4.6.1 Eigenanalysis

4.6.2 Finite rate of increase

4.6.3 Stable stage distribution

4.6.4 Calculating the stable stage distribution

4.6.5 Reproductive value

4.6.6 Sensitivity and elasticity

4.7 Integral projection

4.7.1 A size-based IPM of smooth coneflower

4.7.2 Population summaries

4.8 R packges for demography

4.9 Exploring a real population

Chapter 5

Density-dependent growth

Placeholder

5.1 Continuous logistic growth

5.2 Dynamics around the equilibria — stability

5.2.1 Analytical linear stability analysis

5.2.2 Projection with numerical integration

5.3 Other forms of density-dependent growth

5.3.1 Effects of N on birth and death rates

5.3.2 Theta-logistic growth

5.3.3 Allee effect

5.3.4 The integral of logistic growth

5.4 Discrete Density-dependent Growth

5.4.1 Effects of r_d

5.4.2 Bifurcations

5.4.2.1 Ricker and more

5.5 Maximum Sustained Yield

Chapter 6

Populations in Space

Placeholder

6.1 Source-sink Dynamics

6.1.1 Complications and cases

6.2 Metapopulations

6.2.1 The classic Levins model

6.2.2 Propagule rain

6.2.3 The rescue effect and the core-satellite model

6.2.4 Parallels with Logistic Growth

6.2.5 Levins *vs*. Hanski

6.2.6 Habitat Destruction

6.2.7 Illustrating the effects of habitat destruction

6.2.8 Different assumptions lead to different predictions about rates of extinction

6.3 Hanski's incidence function

Chapter 7

Competition

Placeholder

7.1 Lotka-Volterra Interspecific Competition

7.2 Equilbria

7.2.1 Isoclines

7.2.2 Finding equilibria

7.2.3 Coexistence — the invasion criterion

7.2.4 Other equilibria

7.3 Dynamics at the Equilibria

7.3.1 Determine the equilibria

7.3.2 Create the Jacobian matrix

7.3.3 Solve the Jacobian at an equilibrium

7.3.4 Use the Jacobian matrix

7.3.5 Three interesting equilbria

7.4 Return Time and the Effect of r

7.5 Indirect competition for resources

7.5.1 Linear and nonlinear responses

7.5.2 Relative nonlinearity

7.5.3 Competition for two resources: the resource ratio model

7.6 Summary

Chapter 8

Mutualisms

Placeholder

8.1 Background

8.2 Lotka-Volterra mutualism

8.3 Consumer-resource mutualism

8.3.1 A model of uni-directional mutualism

8.4 Plant-soil feedbacks

8.5 Simulations for learning

8.5.1 `lvg()`

8.5.2 Systematic simulations

8.5.3 Checking simulation results

8.5.4 Comparing simulation results to analytical solutions

8.5.5 One last thing: using the Jacobian matrix

8.5.6 *In Fine*

Chapter 9

Consumer-resource Interactions

Placeholder

9.1 Ratio dependence

9.1.1 Dynamics of ratio dependent predation

9.2 Prey dependence

9.2.1 Dyanmics of prey-dependent predation

9.3 Interlude: Functional response - what an individual predator does

9.4 Stability analysis for the prey-dependent Lotka–Volterra model

9.5 Prey carrying capacity and type II functional response

9.5.1 Paradox of enrichment

Chapter 10

Host-parasitoid relations

Placeholder

10.1 Independent and random attacks

10.1.1 Simulating simple host-parasitoid dynamics

10.1.1.1 Simulating Random Attacks

10.2 Aggregation leads to coexistence

10.2.1 Equilibria for a discrete-time model

10.3 Stability of host–parasitoid dynamics

10.3.0.1 Dynamics of the May host–parasitoid model

10.4 *In Fine*

Chapter 11

Disease

Placeholder

11.1 Closed epidemics

11.1.1 Density-dependent transmission

11.1.2 Frequency-dependent transmission

11.2 Open epidemics

11.3 Modeling data from Bombay

11.3.1 Optimization

Chapter 12

Food webs and other networks

Placeholder

12.1 Food Web Characteristics

12.2 Does omnivory destablize food chains?

12.2.1 Multi-species Lotka–Volterra notation

12.2.2 Background

12.2.3 Implementing Pimm and Lawton's Methods

12.2.4 Shortening the Chain

12.2.5 Adding Omnivory

12.2.6 Comparing Chain A versus B

12.2.7 Re-evaluating Take-Home Messages

12.3 Perhaps mutualism stabilizes bipartite networks

12.3.1 Creating bipartite webs

12.3.2 Testing effects of nestedness and modularity on network resilience.

12.3.3 Path Analysis

12.4 Exploring Pandora, right here at home

12.4.1 Properties assessed

Chapter 13

Diversity

Placeholder

13.1 Background

13.2 Species Composition

13.2.1 Measures of abundance

13.2.2 Dissimilarities and Distances

13.2.3 Displaying multidimensional distances

13.3 Diversity

13.4 Species diversity

13.5 Rarefaction and total species richness

13.5.1 An example of rarefaction and total species richness

13.6 Distributions

13.6.1 Log-normal distribution

13.6.2 Other distributions

13.6.3 Pattern *vs.* process

13.7 Neutral Theory of Biodiversity and Biogeography

13.7.1 Different flavors of neutral communities

13.7.2 Investigating neutral communities

13.8 Species–area relations

13.8.1 Island biogeography

13.9 Diversity Partitioning

13.9.1 Partitioning species–area relations

13.10 Summary

Chapter 14

Appendix

Placeholder

14.1 Very introductory materials

14.2 Writing your own functions

14.3 Iterated Actions: the `apply` Family and Loops

14.3.1 Iterations of independent actions

14.3.2 Dependent iterations

14.4 Probability Distributions and Randomization

14.5 Numerical integration of ordinary differential equations

14.6 Eigenanalysis

14.6.1 Eigenanalysis of demographic versus Jacobian matrices

14.7 Derivation of the right eigenvalues

14.8 Symbols used in this book

Chapter 15
